Notes:
Performance is in Internal Throughput Rate (ITR) ratio based on measurements and projections using standard IBM benchmarks in a controlled environment. The actual throughput that any user will experience will vary depending upon considerations such as the amount of multiprogramming in the user's job stream, the I/O configuration, the storage configuration, and the workload processed. Therefore, no assurance can be given that an individual user will achieve throughput improvements equivalent to the performance ratios stated here.
IBM hardware products are manufactured from new parts, or new and serviceable used parts. Regardless, our warranty terms apply.
All customer examples cited or described in this presentation are presented as illustrations of the manner in which some customers have used IBM products and the results they may have achieved. Actual environmental costs and performance characteristics will vary depending on individual customer configurations and conditions.
This publication was produced in the United States. IBM may not offer the products, services or features discussed in this document in other countries, and the information may be subject to change without notice. Consult your local IBM business contact for information on the product or services available in your area.
All statements regarding IBM's future direction and intent are subject to change or withdrawal without notice, and represent goals and objectives only.
Information about non-IBM products is obtained from the manufacturers of those products or their published announcements. IBM has not tested those products and cannot confirm the performance, compatibility, or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.
Prices subject to change without notice. Contact your IBM representative or Business Partner for the most current pricing in your geography.
Agenda – z/VM Cross System Extensions

- What does CSE do?
- What does CSE not do?
- How do I turn it on?
- How can I share the VM SysRes & Spool volumes?
- How does this get me closer to High Availability?
z/VM without CSE
CSE allows you to:

- Extend the mini disk access control semantics across VM nodes in Plex
  Requires a common VM Source Directory across all nodes in Plex
- Share Spool files across VM nodes in Plex
  Requires spxtape dump & restore to retrofit onto existing systems
- Extend the query and messaging tools across VM nodes in Plex
Ugly Bits: PVM and RSCS are not free...

- PVM is not included in the base cost of z/VM
  - Requires a Special Bid to get licensed on an IFL
  - needed for shared spooling
  - needed for cross system messaging, query

- RSCS is needed to support DirMaint communications if shared spool is not used

- DirMaint is required to support the single source directory
  - Or you have to figure out some other way to guarantee that the object directories are all identical, all the time
CSE does **NOT** allow you to:

- Share VM SysRes volumes for free
  - Each VM system must maintain its own object directory, warm start area, and checkpoint
- Get High Availability for free
  - Some infrastructure will have to be built or bought
- Share SFS pools across VM systems
  - Need TSAF, CS Collection, etc
- Virtual Reserve/Release across VM systems
Enabling CSE – The SYSTEM CONFIG file:

System_Identifier 2064 %01550 LTICVM1

XSPOOL_XLIST_INPUT RSCSDNS VMSERV VServu PVM OPERATOR DTCVSW1 DTCVSW2
Shared RACF database

- Change the RACF database from minis to dedicated volumes that support Hardware Reserve/Release
  - DDR from the minis to full volumes on VM1
  - Change the directory entry and recycle RACF on VM1
  - Add VM2 missing entries to the database
  - Change the directory entry and recycle RACF on VM2

- That's pretty much it – do the same for the rest of the VM systems
RSCS configuration

- RSCS is used for DirMaint message passing if you're not using Shared Spool

```
'CP ATTACH DB45 * DB4' /* Link to LTICVM2 */

```
Format a volume to support XLINK

- Attach the volume to your id

- XLINK FORMAT <vaddr> <volid>
  - XLINK command is split: part built in and part module
    - Module lives on maint's 193
  - Defaults to adding CSE tracks in CYL 0
    - 1 Cyl for mod 3, 9 cyl for mod 9 up to mod 54

- IPL to pick up SYSTEM CONFIG changes if you haven't already

- Make sure “q n” shows you everyone logged on everywhere
  - indicates CSE messaging is up

- Attach the volume to SYSTEM on all VMs

- XLINK CHECK <volid>
  - Volume <volid> is controlled by CSE LINK.
Dirmaint Configuration Overview

- Dirmaint will run on one node in the plex
- DirmSats will run on all other nodes in the plex
- Directory changes are made everywhere.
  - This can take some stern user re-education
- Dirmaint must be equal to or higher than the Dirmsats in code level
Directory Stuff

- Merging the directory is the hardest part of implementing CSE

- On VM1:
  - Add the system affinity information for all VM systems to the DIRECTORY control statement
  - Add SYSAFFIN statements to all guests which will have differences between systems
  - Enable dirmaint & make sure the lock disk (15D) is defined on XLINK controlled DASD

DIRECTORY 0123 3390 VM1IPL *01550-2064 LTICVM1

  MDISK 0191 3390 0072 5 VM9CDS MR RTCPIP WTCPIP MTCPIP
More Directory Stuff

• Once VM1 has SYSAFFIN statements for all systems which will be part of the plex:
  • Using dirmsat as a template, create a new dirmsat user to run on each of the other VM systems: dirmsat2, dirmsat4, dirmsat5, dirmsat7, dirmsat9
  • Create a DVHPROFA DIRMSATx on Dirmaint's C disk for each new dirmsat user
  • Add RACF privileges for the dirmsats if needed
  • Run DIRM USER WITHPASS to consolidate the dirmaint files into a monolithic directory file
  • send USER WITHPASS to each of the other VM systems
Yet More Directory Stuff

• On the other VM systems:
  • Rebuild the directory with directxa using the USER WITHPASS file from VM1
  • Xautolog this system's dirmsat
  • Add the RACF privileges you forgot about when you created it
  • Add FROM= TO= and SATELLITE_SERVER= statements to Dirmaint Config

    SATELLITE_SERVER= DIRMSAT9 LTICVM9
    SATELLITE_SERVER= DIRMSAT5 LTICVM5
    SATELLITE_SERVER= DIRMSAT4 LTICVM4
    SATELLITE_SERVER= DIRMSAT2 LTICVM2
    SATELLITE_SERVER= DIRMSAT1 LTICVM1

    FROM= LTICVM1 TO= LTICVM2 S= RSCS T=LTICVM2
    FROM= LTICVM2 TO= LTICVM1 S= RSCS T=LTICVM1
    ... And so on

  – Force and restart dirmaint on VM1 and dirmsats everywhere else
  – Enjoy the utopia of CSE enabled VM.

Diagram showing the relationship between VMs and Linux systems.
z/VM Shared SysRes

- VM1: linuxD
- VM2: linuxA
- VM4: linuxC
- VM7: linuxE
- VM5: linuxB
- VM9: linuxF

Shared SysRes

User Vols
- Rebuild VM9 on VMQ volumes
- Going to move these off the SysRes packs:
  - Checkpoint
  - Warmstart
  - Directory
  - RW minis for service machines
z/VM Shared SysRes – move the checkpoint

- MAINT's CF1 is going to be shared, so:
  - in SYSTEM CONFIG on CF1
    Imbed -SYSTEM- SYSRES
    Imbed -SYSTEM- CPOWNED
  - in VM9 SYSRES on CF1
    System_Residence,
    Warmstart Volid VM9CD$ From Cylinder 10 For 9,
    Checkpoint Volid VM9CD$ From Cylinder 1 For 9
  - in VM9 CPOWNED on CF1
    CP_Owned Slot 1 &SYSRES
    CP_Owned Slot 2 VM9CD$  
- Don't include multiple
  Directory bearing volumes for other VM systems in CPOWNED
z/VM Shared SysRes

- CP format VM9CDS
  - VM9's Checkpoint, Directory, and Service Machine minis
  - Allocate checkpoint and warmstart as PERM
  - Allocate directory as DRCT
  - Allocate the space for Minis as PERM

<table>
<thead>
<tr>
<th>CYLINDER</th>
<th>ALLOCATION</th>
<th>CURRENTLY IS AS FOLLOWS:</th>
</tr>
</thead>
<tbody>
<tr>
<td>TYPE</td>
<td>START</td>
<td>END</td>
</tr>
<tr>
<td>PERM</td>
<td>0</td>
<td>18</td>
</tr>
<tr>
<td>DRCT</td>
<td>19</td>
<td>58</td>
</tr>
<tr>
<td>PERM</td>
<td>59</td>
<td>3338</td>
</tr>
</tbody>
</table>
z/VM Shared SysRes – rebuild the checkpoint

- SPXTAPE DUMP SPOOL ALL
- IPL CLEAN
  - Trashes all spool space
  - Rebuilds the checkpoint and warmstart data
- SPXTAPE LOAD to get spool files back
z/VM Shared SysRes – move the directory

- Update the Directory for MAINT to include a fullpack mini for VM9CDS at its real device address
- Update the DIRECTORY control block to point to directory space on VM9CDS

DIRECTORY 0123 3390 VM1IPL *01550-2064 LTICVM1
DIRECTORY 0123 3390 VM4IPL *10D05-2066 LTICVM4
DIRECTORY 0123 3390 VM7IPL *41550-2064 LTICVM7
DIRECTORY 0123 3390 VM2IPL *4299E-2094 LTICVM2
DIRECTORY 5502 3390 VM9CDS *4B52A-2084 LTICVM9
DIRECTORY 5623 3390 VM5CDS *168BE-2096 LTICVM5
z/VM Shared SysRes – move the directory

- Get USER WITHPASS to VM9
- Link the fullpack minidisk for VM9CDS
- Run directxa with the flat file
  - Don't update the allocation map after updating the directory
**z/VM Shared SysRes – xlink format**

- Backup everything here before continuing if you don't have another VM system to fix this one

- Is the VMQ SysRes a mod-9? If yes – **STOP**
  - You have to move everything up by 10 Cylinders first

- 1 Run XLINK FORMAT to set up the CSE track on all the VMQ SysRes volumes

- 2 Add XLINK_Volume_Include VMQ* to SYSTEM CONFIG
  - ANY volume labeled VMQ* without a CSE track will not be brought online, at all.

- Alter the allocation map on VMQIPL to remove the directory space

- IPL to check the changes – Should see the message that the Directory on VM9CDS is on line.
z/VM Shared SysRes – move the RW minis

• Start allocating minidisks on VM9CDS for service machines that need R/W space.

• Things like: SFS pool, RACF audit logs, OPERATOR's 191
  - Allocate them as 9xxx
  - Copy from the original to the 9xxx device
  - Flip the addresses so 9xxx is the original on the shared SysRes volume, linked RO
  - Useful for service later
z/VM Shared SysRes

- At this point there should be no RW links to any of the SysRes volumes
- The directory is not on the SysRes volume
- The checkpoint and warmstart areas are not on the SysRes volume
- Now to add VM5 so that it's sharing the VMQ volumes
z/VM Shared SysRes

- Create a new VM5CDS volume from VM9CDS with DDR or FlashCopy
- Turn off directory updates on VM5 by forcing DIRMSAT5
- From VM9 - change the SYSAFFIN statements for VM5's system IDs to point to VMQ volumes
- Add a fullpack minidisk to MAINT for VM5CDS
- Update the DIRECTORY control block to point to the new volume

Summary

- Maintaining Multiple VM systems is easier with CSE
- CSE allows greater flexibility in choosing where to run a workload
- Shared SysRes volumes will ease maintenance and provide more consistency
- CSE provides the infrastructure needed for HA
