What's new with SUSE® Linux Enterprise Server 11 SP1
for IBM System z

Mark Post
Technical Support Engineer IV
mpost@suse.com
Agenda

• Introduction
• New maintenance model
• System z specific
  ‒ Hardware support
  ‒ Performance improvements
  ‒ Usability improvements
  ‒ Software additions/upgrades/removals
  ‒ Miscellaneous changes
Agenda (2)

• Non-System z specific
  - Performance improvements
  - Usability improvements
  - Software additions/upgrades/removals
  - Miscellaneous changes

• Questions (I'll also take questions during the talk, unless we start to run short of time.)

• Backup/general information slides
Introduction

• As the name indicates, SLES11 SP1 is the first service pack of the SLES11 version.

• If you remember the SLES11 announcement, there was a notice of an “Architecture Level Set to only support z9 or later” hardware for System z.
  - The ALS was not done, even though the support terms remained as "z9 and later."
  - The ALS may still be done, but perhaps not until SLES12.

• Note that I will not be talking about any features that were introduced in SLES11. This is only about changes introduced in SLES11 SP1.

• Includes lots and lots of bug fixes created for SLES11.
SUSE Product Lines and Products

Server Product Line
- SUSE Linux Enterprise Server
- SUSE Linux Enterprise Server for System z
- SUSE Linux Enterprise High Availability Extension
- SUSE Linux Enterprise Real Time Extension
- SUSE Linux Enterprise Mono Extension
- SUSE Linux Enterprise Point of Service
- SUSE Linux Enterprise Server for SAP Applications

Desktop Product Line
- SUSE Linux Enterprise Desktop
- LibreOffice

Virtualization Product Line
- SUSE Linux Enterprise Server

Appliance Product Line
- SUSE Studio Online
- SUSE Appliance Toolkit

Specialized Support Offers
- SUSE Linux Enterprise Server Subscription with Expanded Support (for Red Hat migrations)
- SUSE Linux Enterprise Server Priority Support for SAP

SUSE Manager

- SUSE Linux Enterprise Server Priority Support for SAP

SUSE Manager
Standard Product Life-cycle

- 10-year life-cycle (7 years general support, 3 years self support)
- Service packs every 16-18 months, major releases every 3-4 years
- Six month upgrade window
- Long-term service pack support option available
### Current Product Life-cycle Overview

**Notes**
- EOGS: Q3 2011
- EOSS: Q3 2014
- CR: SLE 10 SP3 (2009)
- EOGS: Q3 2013
- EOSS: Q3 2016
- EOGS: Q2 2016
- EOSS: Q2 2019
- GA: 2H 2013

*Note: Milestones in future years are planned dates, and subject to change.*
New Maintenance Model
Benefits to Customers

• Improve Customer Satisfaction by
  - Making Service Packs more lightweight
  - Easier to test and deploy ("consume")
  - Allowing for staying with older versions
  - And remaining supported for the full system

• Answer market needs in between Service Packs by
  - Allowing more Updates in the GU repository
  - Delivering selective Enhancements
    (Mitigates the longer distance between SPs)
Implementation

• One primary repository per major version
  - Starting with the SLES11 SP1 updates repository
  - You may hear references to “GU” (General Update repository) here.
    Keep in mind: GU repo = existing SLES11 SP1 updates repo

• Service Pack repositories contain dependencies that are strictly bound together “patch sets” each with its own repository

• Updates are released when they are ready

• Quality for the enterprise – test entire service pack
New Maintenance Model

- Service Pack
  - Dependencies – ABI/API and other
  - Major impact changes with high configuration QA requirement
  - Examples: intrusive kernel changes; invasive hardware updates

- GU + Previous Service Pack(s)
  - Service pack independent updates
  - Examples: Firefox
  - No delay on features and updates
Maintenance Delivery Evolution

SLES 9
- GA
- SP1
- SP2
- SP3
  - Flexibility

SLES 10
- GA
- SP1
- SP2
- SP3
  - 6 months overlap
  - Control

SLES 11
- GA
- SP1
- SP2
- SP3
  - General Updates (GU)
  - Flexibility + Control

Copyright 2011 SUSE
Where do SP Patches End Up?

• Final decision by SUSE Release Managers and Maintenance Team depending on technical feasibility

• General Rules:
  - Independent new package or fully compatible update, bugfixes or improvements with minor impact
    → SLE 11 SP1 repository = GU Repository
  - New package or fully compatible update, bugfixes or improvements with major impact or high QA need
    → SLE 11 SP1 repository together with Service Pack
  - Change which might affect compatibility or where (new or existing) package depends on other packages in an SP
    → SLE 11 SP(n) repository together with Service Pack
Pick and Choose

• Customers can choose to remain on an arbitrary version of a package in the GU repository
• NTS will support them, i.e.
  ‒ Accept a Service Request on those versions
  ‒ Analyze with the customer if his issue is already fixed
  ‒ Trigger fixing of an obvious issue
  ‒ Try to minimize the need of customers to upgrade
• Fixes to the package will only be delivered on top of the latest version
• If the latest version is in a Service Pack repository, customer either must migrate to that Service Pack or buy LTSS (Long Term Service Pack Support)
System z specific
Hardware support
Hardware Support

• DS8000 large volume support
  - Allows use of volumes with more than 64K cylinders.
  - Uses the CCCHR (vs. CCHHR) addressing scheme (Fate #304026, 307003, IBM # 201597, 201738)

• High Performance FICON
  - DASD driver will use new transport mode control words (TCW) instead of CCWs.
  - Requires z10 or later hardware
  - Only for LPAR installations, not under z/VM (Fate # 307005, IBM # 201742)
Hardware Support (2)

- Format Record 0 on ECKD devices
  - Corrects a problem with formatting non-IBM storage devices (Fate # 307011, 307012, IBM # 201834, 201835)

- OSA QDIO Data Connection Isolation
  - Enables isolating QDIO data connections on a shared OSA-card
  - supports multi-tier security zones (Fate # 307015, IBM # 201899)

- Next generation crypto hardware exploitation
  - That is, crypto cards for the z196 and z114 (CEX2, CEX3)
  - Needs libica 2.0.1 or later (Fate # 307112, IBM # 201995)
Performance improvements
Performance Improvements

- Decimal Floating Point library support: libdfp
  - Includes required glibc infrastructure for I/O
  - Provides everything that is essential to support DFP (Fate # 304044, 307062, IBM # 201180, 201933)

- Crypto Device Driver Thin Interrupts
  - Eliminates polling for work (Fate # 306998, IBM # 201174)

- Kernel vdso support
  - Speeds up system calls to gettimeofday, clock_getres and clock_gettime
  - If you've ever done an strace on a command/program, you'll know why this is very helpful. (Fate # 307013, IBM # 201857)
Performance Improvements (2)

• Iconv character conversion routines speedup
  - Uses the new translate hardware instruction to speedup character conversion routines in glibc
  - Very important if you're doing a lot of EBCDIC ↔ ASCII conversions or running in a non-English or UTF8 locale. (Fate # 304074, IBM # 201185)

• AF_IUCV SOCK_SEQPACKET support
  - Speeds up communications between guests or with z/VM
  - Adds AF_IUCV datagram stream-oriented sockets in addition to the existing AF_IUCV byte stream-oriented sockets (Fate # 307014, IBM # 201885)
Performance Improvements (3)

- Suspend / Resume support
  - Allows you to stop a running Linux instance and later continue operations.
  - A suspended Linux instance does not require memory or processor cycles.
  - Gives you better performance, and resource utilization.
  - Read Chapter 37, Suspending and resuming Linux in the “Device Drivers, Features, and Commands on SUSE Linux Enterprise Server 11 SP1”, SC34-2595-01 manual.

> There is a litany of restrictions and cautions there, as well as “how to” information. (Fate # 307017, IBM # 201901)
Performance Improvements (4)

• FCP performance data reports
  - The item comprises facilities (included in s390-tools) which present the data stored by 'FCP - Performance data collection' in a human readable way.
  - Data presented comprises:
    > Performance relevant data about stack components as Linux devices, SCSI LUNs and HBA and storage controller information
    > Per stack component: current values of relevant measurements as throughput, utilization and other applicable measurements
    > Statistical aggregations (min, max average, histogram) of data associated with I/O requests such as size, latency per component and in total.
Usability improvements
Usability Improvements

• Automatic IPL after dump
  - Similar in concept to z/VM's re-IPL after a CP abend
  - Increase availability, minimize downtime
  - Nice to have in combination with dump on panic (Fate # 306973, 307009, IBM # 201169, 201757)

• TTY terminal server over IUCV
  - Some Linux admins just can't get past the 3215 console interface when the network interface isn't working. This solves that problem
  - Requires a z/VM Linux guest to act as the terminal server.
  - Changes need to be made on each Linux client for access. (Fate # 307001, 307002, IBM # 201734, 201735)
Usability Improvements (2)

- Automatic scan of network devices
  - Introduces znetconf (included in s390-tools) to automatically configure network devices (load proper module, group and bring them online) (Fate # 307016, IBM # 201900)

- Add vmconvert option to vmur tool
  - Allows you to convert on-the-fly a z/VM dump to Linux dump format while reading from the spool and writing to disk. (Fate # 307010, IBM # 201758)

- Provide hardware and hypervisor service levels in Linux
  - Could be helpful in problem diagnosis
  - Introduces a new pseudo-file, /proc/service_levels (Fate # 307008, IBM # 201753)
Usability Improvements (3)

• Report status of DS8000 disk encryption
  - Allows you, without having to ask the storage administrator, if the physical disks where your data is being stored are encrypted or not. (Fate # 307004, IBM 201740)

• FCP/SCSI error recovery hardening
  - Improves error recovery cooperation between SCSI-mid-layer and zFCP by allowing the SCSI error recovery to wait for completion of the zFCP error recovery. (Fate # 307006, IBM # 201743)

• Even more kernel message man pages
  - Now installed by default (Fate # 306999, 307018, IBM # 201727, 201969)
Usability Improvements (4)

- A read-only root file system is now a supported configuration.
  - I haven't had the time to figure out just exactly what this entails.
  - Supposedly based on the IBM Redpaper at http://www.redbooks.ibm.com/abstracts/redp4322.html
    - I haven't really read it or tried to implement what's documented there.
    - I do know that some customers have tried, and had many problems.
  - I'm trying to get a project going with a customer willing to experiment to determine just how that might work.
  - The intent is to do this across all architectures, not just System z. This may or may not limit what we can do on any particular architecture. (Fate # 307235, IBM # 201983)
Software additions/upgrades/removals
Software Add/Upgrade/Removal

- libica 2.0.2 (Fate # 307007, IBM # 201744)
- mt_st 0.9b (Fate # 307019, IBM # 201972)
Miscellaneous changes
FCP Code Cleanup Stage 2

- Stage 2 of the code cleanup covers functional aspects of zFCP driver
- state machine for adapter, port and unit
- layering violation issues regarding request processing
- modify exchange-port, -config data to not use recovery semaphore
- kernel thread API adaption
- remove forced port recovery when port recovery is already running
- lock consolidation (config lock vs. other locks)
- Fate # 304038, IBM # 201546
Non-System z specific
Performance improvements
Performance Improvements

- Tunable sched_mc_powersavings=n framework
  - The power saving loadbalancer CONFIG_SCHED_MC attempts to run the workload in the system on a minimum number of CPU “packages” and tries to keep rest of the CPU packages idle for longer duration.
    - The existing implementation is very conservative and does not work effectively across different workloads, hence this change.
  - IBM is considering enhancing cpuplugd with this functionality. Final results on effectiveness on System z are not yet available. (Fate # 307097, IBM # 201924)
Performance Improvements (2)

- Timer migration from idle CPUs
  - Timers from IRQ context (like the ones in device drivers) are “stuck” on the CPU where they were initialized.
  - This framework will help move all 'movable timers' using a sysctl interface.
Usability improvements
Usability Improvements

• Allow key acceptance in zypper when in non-interactive modes
  - The current version prompts the user to agree to importing a new key into the keyring when a new repository is added.
  - This eliminate those prompts during automated installs. (Fate # 307087, IBM # 201907)
Software additions/upgrades/removals
Software Add/Upgrade/Removal

- The kernel was updated to 2.6.32
  - Done for a number of good reasons, but hopefully a once in a lifetime event.
  - Extensive testing was done to ensure kernel application binary interface (kABI) didn't change.
    > This means ISV software shouldn't have to be re-certified.
- SystemTap 0.9.7 (Fate # 307061, IBM # 201932)
- Java 6 SR6 (Fate # 307083, IBM # 201892)
- CIM SBLIM Java Client 2.0.9.2 (Fate # 307105, IBM # 201984)
Software Add/Upgrade/Removal (2)

- CIM SBLIM packages (Fate # 307089, IBM # 201909)
  - sblim-cmpi-base 1.5.9 (Bug fixes)
  - sblim-cmpi-devel 2.0.0 (CMPI 2.0 compliance)
  - sblim-cmpi-fsvol 1.5.0 (Licence change to EPL)
  - sblim-cmpi-network 1.4.0 (License change to EPL)
  - sblim-cmpi-nfsv3 1.1.0 (License change to EPL)
  - sblim-cmpi-nfsv4 1.1.0 (License change to EPL)
  - sblim-cmpi-params 1.3.0 (License change to EPL)
  - sblim-cmpi-sysfs 1.2.0 (License change to EPL)
  - sblim-cmpi-syslog 0.8.0 (License change to EPL)
  - sblim-gather 2.1.9 (KVM support via libvirt)
  - sblim-testsuite 1.2.5 (bug fixes)
  - sblim-wbemcli 1.6.0 (bug fixes)
Software Add/Upgrade/Removal (4)

- libcgroup 0.34
  - Numerous enhancements - configuration updates and classification updates
  - Numerous bug fixes
  - Newer API (iteration)
  - Improved tools and man pages (cgclear, cgcreate, etc) (Fate # 307064, IBM # 201982)
Post Service Pack 1 Enhancements

• Common Code Base:
  - Firefox
  - SUSE Manager integration
  - Ruby on Rails 2.3.8
  - PHP 5.2.14
  - Unattended Upgrade from SLE 10 to SLE 11

• Server
  - OFED 1.5.2
  - PureFTPd (Netware compatibility)

• Desktop
  - LibreOffice
Miscellaneous changes
Miscellaneous Changes

• CIM sfcb rebuilt with –enable-slp
  - Ensures IBM Director can work with SLES (Fate # 307088, IBM # 201908)

• CIM SBLIM-HBA
  - A set of Storage Management providers in SBLIM helps system management products. (Fate # 307091, IBM # 201917)

• fallocate support added to glibc
  - Having a direct call to fallocate improves cross-platform portability. (Fate # 307179, IBM # 201881)

• IPv6 support in NFS
  - Wasn't quite ready in time for SLES11. (Fate # 307240, IBM # 201026)
Questions
SUSE Linux Enterprise Kernels

- SUSE Linux Enterprise Server 9 (GA 08/2004)
  Kernel 2.6.5, GCC 3.3.3, Service Pack 4 (GA 12/2007)

- SUSE Linux Enterprise Server 10 (GA 07/2006)
  Kernel 2.6.16, GCC 4.1.0, Service Pack 4 (GA 03/2011)

- SUSE Linux Enterprise Server 11 (GA 03/2009)
  Kernel 2.6.27, GCC 4.3.3
  Service Pack 1 Kernel 2.6.32, GCC 4.3.4 (GA 06/2010)

- Backup/general information slides
• As the name indicates, SLES 11 SP1 is the first service pack of the SLES 11 version.

• If you remember the SLES 11 announcement, there was a notice of an "Architecture Level Set to only support z9 or later" hardware for System z.

 ‒ The ALS was not done, even though the support terms remained as "z9 and later."
 ‒ The ALS may still be done, but perhaps not until SLES 12.

• Note that I will not be talking about any features that were introduced in SLES 11. This is only about changes introduced in SLES 11 SP1.

• Includes lots and lots of bug fixes created for SLES 11.
SUSE Product Lines and Products

Server Product Line
- SUSE Linux Enterprise Server
- SUSE Linux Enterprise Server for System z
- SUSE Linux Enterprise High Availability Extension
- SUSE Linux Enterprise Real Time Extension
- SUSE Linux Enterprise Mono Extension
- SUSE Linux Enterprise Server for SAP Applications

SUSE Manager

Desktop Product Line

SUSE Manager
Let's first review Novell's standard platform lifecycle policy. Customers have told us that they want longer product lifecycles so that they can build, test and deploy stable, more durable solution stacks, especially for their mission critical workloads. For this reason, the typical lifecycle for a Novell Linux platform product spans 10 years.

- We provide general support for our Linux platform products for seven full years after their initial release.
- For 3 years after that, we continue to make available all our support content – things like technical informations documents (TIDs), briefs, and guides – in our customer facing support knowledge base.

During the seven year general support period for a particular platform product, Novell will typically release 4 services packs, on average about 1 every 16-18 months.

- Typically contains all of the patches, fixes and updates issued since the previous release of the product.
- Also includes product enhancements and drivers to support new hardware.

Novell strongly encourages its customers to upgrade to the most current service pack available, so that they are using what we know to be the most reliable, secure and best performing version for their enterprise.

- Novell provides an overlapping 6 month support period – a support window when the latest service pack, as well as its prior release, are both simultaneously supported.
- After this six month window, customers calling Novell about a particular support issue will typically be asked to apply all of the patches, fixes and updates required to bring them up to the current release, in order to efficiently and effectively diagnose and resolve their support issue.

Because some customers require more time than 6 months to upgrade to the latest service pack, Novell offers optional long term service pack support options.

- For an additional fee, Novell will extend the overlapping support window by an additional year, allowing customers a full 18 months to upgrade.
With that overview, let’s review the present lifecycle status for SUSE Linux Enterprise (SLE).
• As a reminder - these milestones are our current planned dates, and subject to change.
• This is our best information at this time, and we provide you with these estimates so that you can make better informed plans and roll-out decisions.

Because Novell typically releases a major version of SLE every 3-4 years, at any given point in time, there may be 2 or 3 generally available and supported versions of the platform in the market.
• In fact today, customers with a valid subscription can choose to deploy SLE 11, 10 or 9, or any combination of the three,
• And they are entitled to receive support for all of the versions they deploy. (You should relate that to the information regarding the service packs the page before!! Supported version if updated to the latest service pack)

SLE 9 was first released in Aug 2004
• General support for SLE 9 is currently scheduled to end 7 years after its GA date, in July 2011.
• The current release of this platform is Service Pack 4 (SP4). Another service pack for version 9 is not planned. {note: many customers are using SLES 9 SP4, released in Dec 2007}
• Support information for this platform is scheduled to remain in our knowledge base until July 2014.

SLE 10 was first released in July 2006
• General support for version 10 will be offered until July 2013.
• SUSE Linux Enterprise 10 Service Pack 3 (SLE 10 SP3) was recently released in Oct 2009, and Service Pack 4 (SP4) is planned to be released in the first half of 2011. {note: many customers are using SLES 10 SP2, released in May 2008}

SLE 11 is our most current enterprise Linux platform, and was launched in Mar 2009.
• It is our most versatile, interoperable platform for mission critical computing, and represents the cumulative experience and combined expertise of our in-house engineers and extended community of open source developers.
• Development is presently underway on SUSE Linux Enterprise 11 Service Pack 1 (SLE 11 SP1), and is scheduled to be released later this year.
• SLE 11 is the platform where we will be concentrating the majority of our development efforts. Customers currently using version 9 or 10 should consider upgrading to SLE 11 SP1, to get maximum reliability, security, performance and innovation.
Benefits to Customers

• Improve Customer Satisfaction by
  ‒ Making Service Packs more lightweight
  ‒ Easier to test and deploy ("consume")
  ‒ Allowing for staying with older versions
  ‒ And remaining supported for the full system

• Answer market needs in between Service Packs by
  ‒ Allowing more updates in the GUI repository
  ‒ Delivering selective Enhancements (Mitigates the longer distance between SPs)
• One primary repository per major version
  - Starting with the SLES 11 SP1 updates repository
  - You may hear references to “GU” (General Update repository) here.
  - Keep in mind: GU repo = existing SLES 11 SP1 updates repo
• Service pack repositories contain dependencies that are strictly bound together “patch sets” each with its own repository
• Updates are released when they are ready
• Quality for the enterprise – test entire service pack
New Maintenance Model

- Dependencies – ABI/API and other
  - Major impact changes with high configuration QA requirement
  - Examples: intrusive kernel changes; invasive hardware updates

- GU + Previous Service Pack(s)
  - Service pack independent updates
  - Examples: Firefox
  - No delay on features and updates

SL 11
General Updates (GU)
SP 1
SP 2
SP 3
Where do SUSE Patches End Up?

- Final decision by SUSE Release Manager and Maintenance Team depending on technical feasibility
- General Rules:
  - Independent new package or fully compatible update, bug fixes or improvements with minor impact → SLE 11 SP1 repository = GUI Repository
  - New package or fully compatible update, bug fixes or improvements with major impact or high QA need → SLE 11 SP1 repository with Service Pack
  - Change which might affect compatibility or where (new or existing) package depends on other packages in an SP → SLE 11 SP(n) repository with Service Pack
Pick and Choose

Customers can choose to remain on an arbitrary version of a package in the GUI repository.

NTS will support them, i.e.
- Accept a Service Request on those versions
- Analyze with the customer if his issue is already fixed
- Trigger fixing of an obvious issue
- Try to minimize the need of customers to upgrade

Fixes to the package will only be delivered on top of the latest version.

If the latest version is in a Service Pack repository, customer either must migrate to that Service Pack or buy LTS (Long Term Service Pack Support).
System z specific
DS 8000 large volume support
‒ Allows use of volumes with more than 64K cylinders.
‒ Uses the CCCCHR (vs. CCCHHR) addressing scheme (Fat #304026, 307003, IBM #201597, 201738)

High Performance FICON
‒ DASD driver will use new transport control words (TCW) instead of CCW.
‒ Requires z10 or later hardware.
‒ Only for LPAR installations, not under z/VMM (Fat #307005, IBM #201742)
Format Record 0 on ECKD devices
- Corrects a problem with formatting non-IBM storage devices (Fat # 307011, 307012, IBM # 201834, 201835)

OSA QDIO Data Connection Isolation
- Enables isolating QDIO data connections on a shared OSA-card
- Supports multi-tier security zones (Fat # 307015, IBM # 201899)

Next generation crypto hardware exploitation
- That is, crypto cards for the z196 and z114 (CEX2, CEX3)
- Needs libica 2.0.1 or later (Fat # 307112, IBM # 201995)
Performance improvement
• Decimal Floating Point library support: libdfp
  ‒ Includes required glibc infrastructure for I/O
  ‒ Provides everything that is essential to support DFP (Fate #304044, 307062, IBM #201180, 201933)

• Crypto Device Drives
  ‒ Eliminates polling for work (Fate #306998, IBM #201174)

• Kernel vds o support
  ‒ Speeds up system calls to get time of day, clock_gettime and clock_gettime
  ‒ If you’ve ever done an strace on a command/program, you’ll know why this is very helpful. (Fate #307013, IBM #201857)
• Iconv character conversion routines speed up
  - Uses the new translate hardware instruction to speed up character conversion routines in glibc
  - Very important if you're doing a lot of EBCDIC ↔ ASCII conversions or running in a non-English or UTF-8 locale. (Fate #304074, IBM #201185)
• AF_IUCV SOCKET support
  - Speeds up communications between guests or with z/VMS
  - Adds AF_IUCV data stream-oriented sockets in addition to the existing AF_IUCV byte stream-oriented sockets (Fate #307014, IBM #201885)
Suspend / Resume support

- Allows you to stop a running Linux instance and later continue operations.
- A suspended Linux instance does not require memory or processor cycles.
- Gives you better performance and resource utilization.
- Read Chapter 37, Suspending and Resuming Linux in the "Device Drivers, Features, and Commands on SUSE Linux Enterprise Server 11 SP1" manual.

There is a litany of restrictions and caution, as well as "how to" information. (FatE #307017, IBM #201901)
FCP performance data reports

- The item comprises facilities (included in s390-tools) which present the data stored by 'FCP Performance data collection' in a human readable way.

- Data presented comprises:
  - Performance relevant data about stack components as Linux devices, SCSI LUNs and HBA and storage controller information
  - Per stack component: current values of relevant measurements as throughput, utilization and other applicable measurements
  - Statistical aggregation (min, max, average, histogram) of data associated with I/O requests such as size, latency per component and in total.
• Automatic IPL after dump
  ‒ Similar in concept to z/VMS re-IPL after a CP abend
  ‒ Increase availability, minimize downtime
  ‒ Nice to have in combination with dump on panic (Fate # 306973, 307009, IBM # 201169, 201757)

• TTY terminal server over IUCV
  ‒ Some Linux admins just can't get past the 3215 console interface when the network interface isn't working. This solves that problem
  ‒ Requires a z/VMS Linux guest to act as the terminal server.
  ‒ Changes need to be made on each Linux client for access. (Fate # 307001, 307002, IBM # 201734, 201735)
Automatic scan of network devices
- Introduces znetconf (included in s390-tools) to automatically configure network devices (load proper module, group and bring them online) (Fat #307016, IBM #201900)

Add vmconvert option to vmu r tool
- Allows you to convert on-the-fly a z/VM dump to Linux dump format while reading from the spool and writing to disk. (Fat #307010, IBM #201758)

Provide hardware and hypervisor service levels in Linux
- Could be helpful in problem diagnosis
- Introduces a new pseudo-file, /proc/service_levels (Fat #307008, IBM #201753)
• Report status of DS8000 disk encryption
  - Allows you, without having to ask the storage administrator, if the physical disks where your data is being stored are encrypted or not. (Fat # 307004, IBM 201740)

• FCP/SCI error recovery hardening
  - Improves error recovery cooperation between SCSI-mid-layer and zFCP by allowing the SCSI error recovery to wait for completion of the zFCP error recovery. (Fat # 307006, IBM # 201743)

• Even more kernel message map pages
  - Now installed by default (Fat # 306999, 307018, IBM # 201727, 201969)
A read-only root file system is now supported.

‒ I haven't had the time to figure out exactly what this entails.

‒ I haven't really read it or tried to implement what's documented there.

‒ I do know that some customers have tried, and had many problems.

‒ I'm trying to get a project going with a customer willing to experiment to determine just how that might work.

‒ The intent is to do this across all architectures, not just System z. This may or may not limit what we can do on any particular architecture. (Fate # 307235, IBM # 201983)
SOFTWARE ADDITIONS/UPGRADES/REMOVALS
Miscellaneous changes
Stage 2 of the code cleanup covers functional aspects of zFCP driver.

- State machine for adapter, port, and unit layering issues regarding request processing
- Modify exchange-port, -config data to not use recovery semaphore
- Kernel thread API adaptation
- Remove forced port recovery when port recovery is already running
- Lock consolidation (config lock vs. other locks)

Fat #304038, IBM #201546
Non-System z specific
Performance improvements
Copyright 2011 SUSE

Performance Improvements

- Tunable sched_mcs_powersaving = framework
  The power saving load balancer CONFIG_SCHED_MCS attempts to run the workload in the system on a minimum number of CPU "packages" and tries to keep the rest of the CPU packages idle for longer duration.

- The existing implementation is very conservative and does not work effectively across different workloads, hence this change.

- IBM is considering enhancing cpu plugd with this functionality.

Final results on effectiveness on System z are not yet available.

(Fate # 307097, IBM # 201924)
• Timer migration from idle CPUs
  ‒ Timers from IRQ context (like the ones in device drivers) are "stuck" on the CPU where they were initialized.
  ‒ This framework will help move all "movable timers" using a sysctl interface.
Usability improvements
All key acceptance in zypper when in non-interactive modes

- The current version prompts the user to agree to importing a new key into the keyring when a new repository is added.
- This eliminates those prompts during automated installs. (Fate #307087, IBM #201907)
SOFTWARE ADDITIONS / UPGRADES / REMOVALS
The kernel was updated to 2.6.32. Done for a number of good reasons, but hopefully a once in a lifetime event.

Extensive testing was done to ensure kernel application binary interface (KABI) didn't change. This means ISV software shouldn't have to be re-certified.

- SystemTap 0.9.7 (Fate #307061, IBM #201932)
- Java 6 SR6 (Fate #307083, IBM #201892)
- CIM SBLIM Java Client 2.0.9.2 (Fate #307105, IBM #201984)
CIM SBLIM packages (Fate # 307089, IBM # 201909)

- sblim-cmpi-base 1.5.9 (Bug fixes)
- sblim-cmpi-devel 2.0.0 (CMPI 2.0 compliance)
- sblim-cmpi-fsvol 1.5.0 (License change to EPL)
- sblim-cmpi-network 1.4.0 (License change to EPL)
- sblim-cmpi-ifsrv3 1.1.0 (License change to EPL)
- sblim-cmpi-ifsrv4 1.1.0 (License change to EPL)
- sblim-cmpi-params 1.3.0 (License change to EPL)
- sblim-cmpi-sysfsv 1.2.0 (License change to EPL)
- sblim-cmpi-syslog 0.8.0 (License change to EPL)
- sblim-gather 2.1.9 (KVM support via libvirt)
- sblim-testsuite 1.2.5 (Bug fixes)
- sblim-wbemcli 1.6.0 (Bug fixes)
libc group 0.34

- Numerous enhancements - configuration updates and classification updates
- Numerous bug fixes
- Newer API (iteration)
- Improved tools and man pages (e.g., cgclear, cgcreate, etc.) (Fate #307064, IBM #201982)
Copyright 2011 SuSE

Post Service Pack 1 Enhancements

• Common Code Base:
  ‒ Firefox
  ‒ SuSE Manager integration
  ‒ Ruby on Rails 2.3.8
  ‒ Unattended Upgrade from SLE 10 to SLE 11

• Server
  ‒ OFE 1.5.2
  ‒ Pure FTPd (Netware compatibility)

• Desktop
  ‒ Libre Office
Miscellaneous changes
C I M s f c b r e b u i l t w i t h – e n a b l e - s l p

Ensures IBM Director can work with SLES (Fat  # 307088, IBM #201908)

C I M S B L I M - H B A

A set of Storage Management providers in SBLIM helps system management products. (Fat  # 307091, IBM #201917)

fallocate support added to glibc

Having a direct call to fallocate improves cross-platform portability. (Fat  # 307179, IBM #201881)

I P v 6 support in NFS

Wasn’t quite ready in time for SLES11. (Fat  # 307240, IBM #201026)
Backup Material
[1] The maximum file size above can be larger than the file system's actual size due to usage of sparse blocks. It should also be noted that unless a file system comes with large file support (LFS), the maximum file size on a 32-bit system is 2 GB (231 bytes). Currently all of our standard file systems (including ext3 and ReiserFS) have LFS, which gives a maximum file size of 263 bytes in theory. The numbers given in the above tables assume that the file systems are using 4 KiB block size. When using different block sizes, the results are different, but 4 KiB reflects the most common standard.

[2] Btrfs is a copy-on-write logging-style file system, so rather than needing to journal changes before writing them in-place, it writes them in a new location, and then links it in. Until the last write, the new changes are not “committed.”
Add/remove: This increases the uptime and availability of the Linux guest and the provided applications.

Disk subsystem: Performance analysts would like to have the same view into SCSI over Fibre Channel performance. This feature allows performance analysts to more quickly determine if anything in the SCSI subsystem is causing a performance problem or not.

Many of these features are available only when running SLES in an LPAR. The existing OSA layer-2 support is utilized to enable HiperSockets layer-2. This includes IPv6 support for HiperSocket layer-2. This support is available only on z10, running Linux on system z in an LPAR or as a z/VM guest.
**IUCV** allows establishing point to point communication channels, either between 2 virtual machines or between a virtual machine and hypervisor services.

In IUCV terminology, the session between 2 end points is called a PATH. It is identified at each end by a Path ID which is only relevant to the virtual machine that owns the session end. A path is always a connected channel - meaning there are no connectionless paths.

This feature allows for data exchange between VMs without the need to protocol overhead, e.g. like TCPIP. The user is kind of allowed to specify his own protocol.
