

# Linux/390 System Management for the Mainframe System Programmer

I know how to do “abc” with my usual OS.  
How do I do that with Linux/390?

Mark Post

Sunday, May 22, 2005

## About me

- Mark Post (mark.post@eds.com)
- Senior Infrastructure Specialist (Systems Programmer, “plus”)
- EDS, Auburn Hills, Michigan
- Worked with IBM mainframes since entering college in 1973.
- Supported MVS and VM for GM and EDS
- Linux and Linux/390 Technical Lead since 01/2003

## My Linux background

- First installed Slackware Linux on a PC at home in 1998.
- Involved with Linux/390 since May of 2000.
- Co-author of IBM Redbook:“Linux for zSeries and S/390: Distributions,” SG24-6264
- Active in the Linux-390 mailing list hosted by Marist College.
- Webmaster for the linuxvm.org web site.
- Ported Slackware® Linux to the mainframe, released as Slack/390 in July of 2004.

# Agenda

- Cultural differences
- Terminology
- How does Linux/390 compare to Unix System Services?
- How does Linux/390 compare to other Linux platforms?
- What is a distribution, and why doesn't IBM have one?
- What hardware does Linux/390 support?

## Agenda (2)

- What networking connections does Linux/390 support?
- Where's SYS1.PARMLIB kept?
- Do I *really* have to know all this stuff?
- Linux/390 DASD management
- Backup and restore
- Software and maintenance management
- Data sharing with Linux/390 and other OS

## Agenda (3)

- Job scheduling
- Security and user management
- Diagnostic information available (or not)
- Editors
- Basic vi concepts
- Scripting languages
- System logs
- Basic commands

## Agenda (4)

- Advanced commands
- Kernel modules, insmod and modprobe
- System startup and shutdown
- Performance management
- Creating additional images
- Additional information resources
  - Web sites, Redbooks/pieces/tips, Usenet (news), O'Reilly Books
- Command comparisons

# Cultural differences

- Open Source Community
- Open Source software
- Software quality
- Where and how you get support
- Expectations of self-reliance
- 3270 terminals vs VTxxx.
- Install Linux on a PC and use it.
- Is rebooting unnecessarily a sin?

# Terminology

- IPL
- nucleus
- PLPA / LINKLIST
- TSO / CMS
- OSA
- PTF / APAR
- IEBUPDTE
- IEBUPDTE input
- SuperC / COMPARE
- xedit update mode
- boot
- kernel
- kernel modules
- shell
- NIC
- patch
- patch
- diff
- diff
- diff

## Terminology (2)

- paging space
- multi-processor
- systems Programmer
- GUI
- pattern matching
- help files
- STC / SVM
- address space
- task (tcb)
- swap volume / file
- SMP
- system Administrator
- X / X-Window
- regular expression
- man pages
- daemon
- process
- thread

## Terminology (3)

- runlevel
- device driver
- tarball (tar - tape archive)
  - `tar -cf backup.tar file1 file2 file3 file4`
  - `tar -xf backup.tar`
  - `tar -zcf backup.tar.gz file1 file2 file3 file4`
    - equivalent to tar command followed by gzip command
  - `tar -zcf backup.tgz file1 file2 file3 file4`
  - `tar -jcf backup.tar.bz2 file1 file2 file3 file4`
  - `tar -zxf backup.tgz`

## How does Linux/390 compare to...

- Unix System Services
  - Linux/390 is “real” UNIX “under the covers.” Things that run on most other Unix systems can be run on Linux/390, usually without change (assuming source is available).
  - There is no such thing as SMP/E or SES in UNIX / Linux. (Not that USS really uses it either, per se.)
  - Option “switches” on various commands are different, due to different shells, or compliance to different standards.

## How does Linux/390 compare to...

- Unix System Services (cont.)
  - The Linux man pages work without extra effort on OS/390 side.
  - There's no confusion about which TCP/IP parameters are put where.
  - Things that you learn about other UNIX systems are generally easier to apply to Linux than USS.
  - There's no "other side" (OS/390) to help bail you out when things get messed up.
  - Native ASCII. No EBCDIC  $\Leftrightarrow$  ASCII conversions.

## How does Linux/390 compare to...

- Unix System Services (cont.)
  - Source code is available.
  - Default shell is more often bash than (t)csh.
  - No 3270 interface/limitations to work around. Which also means no real ISPF. (You can buy a clone of it, though.)
  - PL/1, CLISTs are not available.
  - REXX is available, but called Regina.
  - HLASM is now available from Tachyon Software.

## How does Linux/390 compare to...

- Other Linux Platforms
  - Very similar, but it lacks a lot of common PC-type hardware
  - 3270 support included for consoles in LPAR mode
  - S/390 specific hardware

# What are distributions?

- VARs
- System Integrators
- Packagers
- Maintainers
- Developers
- Support
- Why doesn't IBM have one?

## Linux/390 hardware support

- Any processor that supports the “Halfword Immediate and Relative Branch Feature” instructions added with the G2.
- For decent performance, IEEE FPU is needed. (G5 and up, MP3000.)
- ECKD DASD
- FBA DASD
- 3480/3490/3590 Tapes
- SCSI over FCP now available

## Linux/390 networking connections

- 3172
- OSA-2 (Token-Ring, Ethernet, Fast Ethernet)
- OSA-Express (Ethernet, Fast Ethernet )
- 2216 (Token Ring, Ethernet )
- QDIO OSA-Express (Gb Ethernet, Fast Ethernet)
- ESCON / CTC (native and under VM)
- IUCV (only under VM)
- HiperSockets (native and under VM)
- Guest LANs (only under VM)
- Cisco CLAW (CIP) - driver by UTS Global

## Where's SYS1.PARMLIB kept?

- Just about everything you need is kept under /etc (at some level of hierarchy).
- Individual text files (or groups of them), since no concept of a PDS in Linux.
- Some *really* important ones:
  - /etc/passwd
  - /etc/shadow
  - /etc/group
  - /etc/gshadow
  - /etc/inittab
  - /etc/inetd.conf
  - /etc/modules.conf
  - /etc/fstab
  - /etc/hosts
  - /etc/resolv.conf
  - /etc/rc.d/...
  - /etc/httpd/...
  - /etc/sysconfig/...
  - /etc/samba/...
  - /etc/pam.d/...
  - /etc/ssh/...

## Do I *really* have to know all this stuff?

- No, but shouldn't you?
- If you really don't want to know what's going on or have a large virtual farm:
  - YaST (SuSE)
  - Nautilus (Red Hat)
  - Webmin (completely perl-based)
  - AdminUX (Green Light Advantage)
  - linuxconf (no longer recommended by RH)
  - Others

# Linux/390 DASD management

## Quick Overview:

- 2 kinds of DASD layouts, cdl and ldl.
- Adding/removing DASD
- Preparing DASD for use
  - Formatting
  - Partitioning (2.4.x kernels only)
  - Creating file systems and Swap
  - File systems vs. directories
- Backing up your DASD

# Adding/Removing DASD

- For 2.4.x kernels, can be dynamic:
  - Adding a device
    - `echo "add device range=devno-range " > /proc/dasd/devices`
  - Disabling a device
    - `echo "set device range=devno-range off " > /proc/dasd/devices`
  - Enabling a device
    - `echo "set device range=devno-range on " > /proc/dasd/devices`
    - Still want to update `/boot/parmfile` or `/etc/zipl.conf` and re-run “zipl” to make the change permanent. (mkinitrd may also be required.)
- 2.6.x kernels use a completely different means.
- For 2.2.x kernels, requires updating `/boot/parmfile`, re-running “silo,” and rebooting.

## Formatting DASD - 2.4.x, 2.6.x

- `dasdfmt -b 4096 [ -l volser ] [ -d layout ]`  
    `-f /dev/dasd?`  
    `-n 0d18`            (only if devfs is in use)
  - `dasdfmt -b 4096 -d cdl -f /dev/dasda`
  - `dasdfmt -b 4096 -d ldl -n 0cf3`
  - `dasdfmt -b 4096 -d cdl -n 0d2f`
- `fdasd /dev/dasd?`
  - Must create one, two, or three partitions

## Formatting DASD - 2.2.x

- `dasdfmt -b 4096 [ -l volser ] -f /dev/dasd?`
- `dasdfmt -b 4096 [ -l volser ] -n fc23`

# Creating file systems and Swap

- 2.4.x, 2.6.x Kernels
  - `mke2fs -b 4096 /dev/dasd?1,2,3`
    - `mke2fs -b 4096 /dev/dasda1`
    - `mke2fs -b 4096 /dev/dasda2`
    - `mke2fs -b 4096 /dev/dasda3`
- 2.2.x Kernels
  - `mke2fs -b 4096 /dev/dasd?1`
    - `mke2fs -b 4096 /dev/dasda1`
    - `mke2fs -b 4096 /dev/dasdb1`
  - `mkswap /dev/dasd?1` (2.2 kernels)
  - `mkswap /dev/dasd?1,2,3` (2.4 kernels)

# File systems vs. directories

/ (root)

/bin

/boot \*

/dev

/etc

/home

/lib

/mnt

/opt

/proc

/root (not to be confused  
with / root)

/sbin

/tmp

/usr

/var

# Backup and restore

- Native Linux facilities
  - afio/cpio/tar
- Software packages (Open Source and proprietary)
  - Amanda / offlinr
  - DFSMSdss / DDR
  - Tivoli TSM/ADSM
  - Innovation FDRINSTANT/UPSTREAM
  - CA BrightStor
  - SecureAgent SecureBackup
  - UTS Global TSS-BAR
  - Veritas NetBackup

## Software & maintenance management

- Since there is no such thing as SMP/E or SES, you have to learn a new mindset.
- There are “binary” packages for several platforms, primarily Intel. Different distributions use different methods to manage those packages: RPM, dpkg.
- Source packages (RPM, tar.gz, etc.) are always available for Open Source software.

## Software & maintenance management (2)

- In a number of cases, there is no binary available for Linux/390. Compiling from source is the only option. This can be *very* easy or *very* difficult, depending on the package.
- You will become very familiar with the 'tar,' 'gzip,' and 'make' commands. Most likely 'patch' and 'diff' as well.

## Software & maintenance management (3)

- Keeping track of security patches is *very* important, and people-intensive.
- Getting email notifications from security sources (CERT, etc.) is recommended.
- If you *have* to install a package from source, it probably won't be too difficult.
  - `tar -zxf package.name.tar.gz`
  - `cd package-directory`
  - `./configure`
  - `make`, and then `make install`

# Using RPM

- VERY high-level!
  - rpm -i package.name.rpm (install)
  - rpm -e package.name (remove)
  - rpm -q package.name (query)
  - rpm -ql package.name
  - rpm -qlp package.name.rpm
  - rpm -qa
  - rpm -qf /path/to/file/name
- dpkg on Debian-based systems

## Data sharing with Linux/390 and other OS

- No direct, hard-wired sharing
- z/OS and z/VM don't "know" ext2
- Linux doesn't "know" VTOCS, etc.
  - Except now it does. But, no security!
- Various network-based methods
  - NFS
  - GFS
  - AFS
  - Samba (SMB / CIFS / MS Networking)
- Under VM - sharing minidisks *read-only* between guests.

# Job scheduling

- Linux native facilities
  - cron
  - at
- Open Source:
  - DQS
  - queue
  - OpenPBS
  - generic NQS
- Proprietary
  - CA-7 Agent
  - Jobtrac
  - CA Scheduler
  - PBSPro

## Security and user management

- Security is an ongoing process, not a status. It must be constantly attended to for you to have any chance at all.
- Most successful security breaches come from employees of a company, not outsiders.
- In contrast to typical mainframe security, Linux security is more network oriented.
- If possible, have a UNIX security person handle your Linux security needs.

## Security and user management (2)

- Turn off *ALL* unnecessary services: telnet, ftp, smtp, time, finger, http, pop3, imap, login, shell, printer, nfs, etc., etc.
- Use OpenSSH instead of telnet, ftp, rlogin, rsh, rexec, rlogin, etc..
- Use shadow password utilities.
- Use TCP Wrappers (/etc/hosts.allow, etc.)
- Review your system logs regularly.
- Monitor security alerts from your suppliers, and from various security organizations.

## Security and user management (3)

- Don't lump all your users into one group (typically "users").
- Don't create a separate group for each user (Red Hat's approach).
- Try to have reasonable groups defined so that people can share data appropriately, and put the proper users into them.
- Don't give *anyone* a UID of zero unless it's absolutely necessary (and even then think about other ways to avoid it).

## Security and user management (4)

- Various tools are available for adding, deleting and changing user and group definitions. All information about users and groups are in plain text files.
- SuSE has YaST
- Red Hat has Nautilus and redhat-config-\* tools
- Webmin is popular
- linuxconf was popular, but should not be used
- useradd, userdel, usermod, groupadd, groupdel, groupmod are common

## Security and user management (5)

- Protect the password of “root” very carefully.
- Login as “yourself” and su to root only when really needed.
- Consider using /etc/suauth to allow designated people to “su” using their own password.
- Consider using /etc/sudoers to grant some selected command authority to designated people.

# Diagnostic information

- strace
- ulimit (to enable core dumps)
- gdb
- uptime
- top
- ksymoops
- netstat
- ping
- traceroute
- system logs
- dmesg
- standalone dump (2.4.x and 2.6.x kernels only)

## Editors (Holy War fodder)

- vi / vim / elvis
- emacs / xemacs
- joe
- jed
- jove
- ed (sed)
- nano
- pico
- ne
- ned (3270 enabled)
- Nedit
- THE (The Hessling Editor)

**No native free ISPF/PDF clones.**  
(2 proprietary ones)

## Basic vi concepts

- Cursor keys work as expected (or h-j-k-l), as do Page up and Page Down, Delete and Backspace (when ssh client is properly configured.)
- Two important modes: command, insert.
- I'm pretty unfamiliar with vi, so I basically use insert mode and command mode.
- Insert button = insert mode (twice = replace)
- ESC = exit insert/command mode to visual mode.

## Basic vi concepts (2)

- `:set smd` or `:set showmode`
  - gives visual indicator what mode you're in
- `:d` = delete a line
- `:w` = write updated file to disk
- `:x` = write updated file to disk and exit
- `:q` = quit if no updates have been made since the last save (`:w`)
- `:q!` = quit regardless
- `:help` = help me!

## Scripting languages (Holy War cont.)

- perl
- ash / bash / csh / tcsh / ksh / ksh93 / zsh
- Regina (REXX)
- OREXX
- Tcl

# System logs

- Most of what you want will be in `/var/log`, or in a subdirectory of it.
- Names and contents vary by distribution
- Reviewing them *frequently* is important
- Samples:
  - `/var/log/messages`
  - `/var/log/syslog`
  - `/var/log/debug`
  - `/var/log/boot.log`
  - `/var/log/dmesg`
  - `/var/log/proftpd.log`
  - `/var/log/maillog`
  - `/var/log/warn`
  - `/var/log/httpd/...`
  - `/var/log/samba/...`

## Basic commands

- **rm -rf /\***
- cd
- cp
- mv
- rm
- ls
- find
- grep
- cat
- less / more
- man
- info
- mount
- umount
- mkdir
- rmdir
- ps
- pushd
- popd
- which

## Advanced commands

- ifconfig
- netstat
- route
- ping
- host / nslookup
- traceroute
- su
- sudo
- gzip / bzip2
- last
- chmod
- chown
- dmesg
- du
- df
- locate
- top
- sed
- head
- tail
- silo / zipl
- wget
- export
- file
- insmod
- modprobe
- lsmod
- rmmod
- telinit

## Kernel modules, insmod and modprobe

- The kernel contains all the code necessary to run as an operating system. This includes device drivers, file system drivers, networking code, etc.
- Kernel modules are parts of the kernel that don't have to be compiled into the kernel itself (but can be if you want to).
- This can allow you to update these components on the fly, without rebooting.

## Kernel modules, insmod and modprobe (2)

- Since modules are *not* in the kernel, how do they get loaded into kernel storage?
  - insmod
  - modprobe
  - dynamically by the kernel if /etc/modules.conf has the right data in it.
- How does the module get it's parameters?
  - provided on insmod command
  - read from /etc/modules.conf by modprobe and the kernel.

## Kernel modules, insmod and modprobe (3)

- How does the kernel find the module?
  - Usually in `/lib/modules/kernelver/something...`
  - `depmod -a` command creates a cross reference of the modules and where they are located, and writes it into `/lib/modules/kernelver/modules.dep.`
  - `modprobe` figures out the dependencies and loads the modules in the right order. `insmod` does not do this.

## System startup and shutdown

- From the HMC, just like any other OS, except no loadparms are needed/used.
- From VM, there are usually some CMS/CP commands issued in PROFILE EXEC, followed by a 'CP IPL devno CLEAR'
- From VM, you can still IPL from the reader, if desired.
- snIPL (simple network IPL)
- How the rest of the system is brought up by init is a very complex process, beyond the scope of this talk.

## System startup and shutdown (2)

- When shutting down, it is important to do it *properly*. File system corruption and data loss can result otherwise.
- Use the halt, reboot or shutdown command.
- You can use shutdown to warn any logged on users, and/or set the shutdown to some time in the future.
- The shutdown command has options to reboot, halt, or cancel a previous shutdown command.

# Performance management

- Some “standalone” native Linux tools:
  - top, ntop, httpperf, sar, iostat, gkrellm, pload, statnet, Big Brother, iptraf
  - Understand that in a shared environment, such as z/VM, these will *all* be lying to you in certain ways.
- Proprietary products
  - Velocity Software ESALPS (under z/VM)
  - BMC MAINVIEW
  - Candle OMEGAMON XE

## Creating additional images

- Some commercial tools
- Can be done with home grown tools
- For large “penguin farms,” knowing what to share between images and how is key.
- IBM Redbook “Linux on IBM zSeries and S/390: ISP/ASP Solutions,” SG24-6299

# Questions?
