

Linux/390 System Management for the Mainframe System Programmer

I know how to do "abc" with my usual OS. How do I do that with Linux/390?

Mark Post

Sunday, April 9, 2006

About me Mark Post (mark.post@eds.com) lacksquareSenior Infrastructure Specialist (Systems lacksquareProgrammer, "plus") EDS, Auburn Hills, Michigan Worked with IBM mainframes since entering college in 1973. Supported MVS and VM for GM and EDS Linux and Linux/390 Technical Lead since 01/2003

My Linux background

- First installed Slackware Linux on a PC at home in 1998.
- Involved with Linux/390 since May of 2000.
- Co-author of IBM Redbook:"Linux for zSeries and S/390: Distributions," SG24-6264
- Active in the Linux-390 mailing list hosted by Marist College.
- Webmaster for the linuxvm.org web site.
- Ported Slackware® Linux to the mainframe, released as Slack/390 in July of 2004.

Agenda

- Cultural differences
- Terminology
- How does Linux/390 compare to Unix System Services?
- How does Linux/390 compare to other Linux platforms?
- What is a distribution, and why doesn't IBM have one?
- What hardware does Linux/390 support?

Agenda (2)

- What networking connections does Linux/390 support?
- Where's SYS1.PARMLIB kept?
- Do I *really* have to know all this stuff?
- Linux/390 DASD management
- Backup and restore
- Software and maintenance management
- Data sharing with Linux/390 and other OS

••••

Agenda (3)

- Job scheduling
- Security and user management
- Diagnostic information available (or not)
- Editors
- Basic vi concepts
- Scripting languages
- System logs
- Basic commands

Agenda (4)

Advanced commands

- Kernel modules, insmod and modprobe
- System startup and shutdown
- Performance management
- Creating additional images
- Additional information resources
 - Web sites, Redbooks/pieces/tips, Usenet (news), O'Reilly Books
- Command comparisons

Cultural differences

- Open Source Community
- Open Source software
- Software quality
- Where and how you get support
- Expectations of self-reliance
- 3270 terminals vs VTxxx.
- Install Linux on a PC and use it.
- Is rebooting unnecessarily a sin?

••••

Terminology

• IPL

- nucleus
- PLPA / LINKLIST
- TSO / CMS
- OSA
- PTF / APAR
- IEBUPDTE
- IEBUPDTE input
- SuperC / COMPARE
- xedit update mode

- boot
- kernel
- kernel modules
- shell
- NIC
- patch
- patch
- diff
- diff
- diff

Terminology (2)

- paging space
- multi-processor
- systems programmer
- GUI

- pattern matching
- help files
- STC / SVM
- address space
- task (tcb)

- swap partition/volume/file
- SMP
- system administrator
- X / X-Window
- regular expression
- man pages
- daemon
- process
- thread

Terminology (3)

• runlevel

- device driver
- tarball (tar tape archive)
 - tar -cf backup.tar file1 file2 file3 file4
 - tar -xf backup.tar
 - tar -zcf backup.tar.gz file1 file2 file3 file4
 - equivalent to tar command followed by gzip command
 - tar -zcf backup.tgz file1 file2 file3 file4
 - tar -jcf backup.tar.bz2 file1 file2 file3 file4
 - tar -zxf backup.tgz

• Unix System Services

- Linux/390 is "real" UNIX "under the covers." Things that run on most other Unix systems can be run on Linux/390, usually without change (assuming source is available).
- There is no such thing as SMP/E or SES in UNIX / Linux. (Not that USS really uses it either, per se.)
- Option "switches" on various commands are different, due to different shells, or compliance to different standards.

• Unix System Services (cont.)

- The Linux man pages work without extra effort on OS/390 side.
- There's no confusion about which TCP/IP parameters are put where.
- Things that you learn about other UNIX systems are generally easier to apply to Linux than USS.
- There's no "other side" (OS/390) to help bail you out when things get messed up.
- Native ASCII. No EBCDIC <=> ASCII conversions.

• Unix System Services (cont.)

- Source code is available.
- Default shell is more often bash than (t)csh.
- No 3270 interface/limitations to work around.
 Which also means no real ISPF. (You can buy a clone of it, though.)
- PL/1, CLISTs are not available.
- REXX is available, but called Regina.
- OREXX is available.
- HLASM is now available from Tachyon Software.

How does Linux/390 compare to...

• Other Linux Platforms

- Very similar, but it lacks a lot of common PCtype hardware
- 3270 support included for consoles in LPAR mode
- S/390 specific hardware

What are distributions?

• VARs

- System Integrators
- Packagers
- Maintainers
- Developers
- Support
- Why doesn't IBM have one?

- Any processor that supports the "Halfword Immediate and Relative Branch Feature" instructions added with the G2.
- For decent performance, IEEE FPU is needed. (G5 and up, MP3000.)
- ECKD DASD
- FBA DASD
- 3480/3490/3590 Tapes
- SCSI over FCP now available

Linux/390 networking connections

• 3172

- OSA-2 (Token-Ring, Ethernet, Fast Ethernet)
- OSA-Express (Ethernet, Fast Ethernet)
- 2216 (Token Ring, Ethernet)
- QDIO OSA-Express (Gb Ethernet, Fast Ethernet)
- ESCON / CTC (native and under VM)
- IUCV (only under VM)
- HiperSockets (native and under VM)
- Guest LANs (only under VM)
- Cisco CLAW (CIP) driver by UTS Global

Where's SYS1.PARMLIB kept?

- Just about everything you need is kept under /etc (at some level of hierarchy).
- Individual text files (or groups of them), since no concept of a PDS in Linux.
- Some *really* important ones:
- /etc/passwd
- /etc/shadow
- /etc/group
- /etc/gshadow
- /etc/inittab

- /etc/inetd.conf
- /etc/modules.conf
- /etc/fstab
- /etc/hosts
- /etc/resolv.conf

- /etc/rc.d/...
- /etc/httpd/...
- /etc/sysconfig/…
- /etc/samba/...
- /etc/pam.d/...
- /etc/ssh/...

04/09/2006

Copyright 2002-2006 by Mark Post

- No, but shouldn't you?
- If you really don't want to know what's going on or have a large virtual farm:
 - YaST (SuSE)
 - Nautilus (Red Hat)
 - Webmin (completely perl-based)
 - AdminUX (Green Light Advantage)
 - (no longer recommended by RH)
 - Others

- linuxconf

Linux/390 DASD management

Quick Overview:

- 2 kinds of DASD layouts, cdl and ldl.
- Adding/removing DASD
- Preparing DASD for use
 - Formatting
 - Partitioning (2.4.x kernels only)
 - Creating file systems and Swap
 - File systems vs. directories
- Backing up your DASD

Adding/Removing DASD

• For 2.4.x kernels, can be dynamic:

- Adding a device
- echo "add device range=devno-range " > /proc/dasd/devices
- Disabling a device
- echo "set device range=devno-range off " > /proc/dasd/devices
- Enabling a device
- echo "set device range=devno-range on " > /proc/dasd/devices
- Still want to update /boot/parmfile or /etc/zipl.conf and re-run "zipl" to make the change permanent. (mkinitrd may also be required.)
- 2.6.x kernels use a completely different means.
- For 2.2.x kernels, requires updating /boot/parmfile, rerunning "silo," and rebooting.

Adding/Removing DASD in 2.6.x

- /sys/bus/ccw/devices/0.0.0601@
- /sys/bus/ccw/drivers/dasd-eckd/0.0.0601@
- /sys/bus/css/devices/0.0.0016@
- /sys/bus/css/drivers/io_subchannel/0.0.0016@
- /sys/devices/css0/0.0.0016/
 - 0.0.0601/ bus@ chpids driver@ pimpampom

- /sys/devices/css0/0.0.0016/0.0.0601/
 - Availability
 - bus@
 - cmb enable
 - cutype
 - devtype
 - discipline
 - driver@

 - readonly
 - use_diag

Use /sbin/chccwdev instead

chccwdev --online 0.0.0601

chccwdev --e 0.0.0601

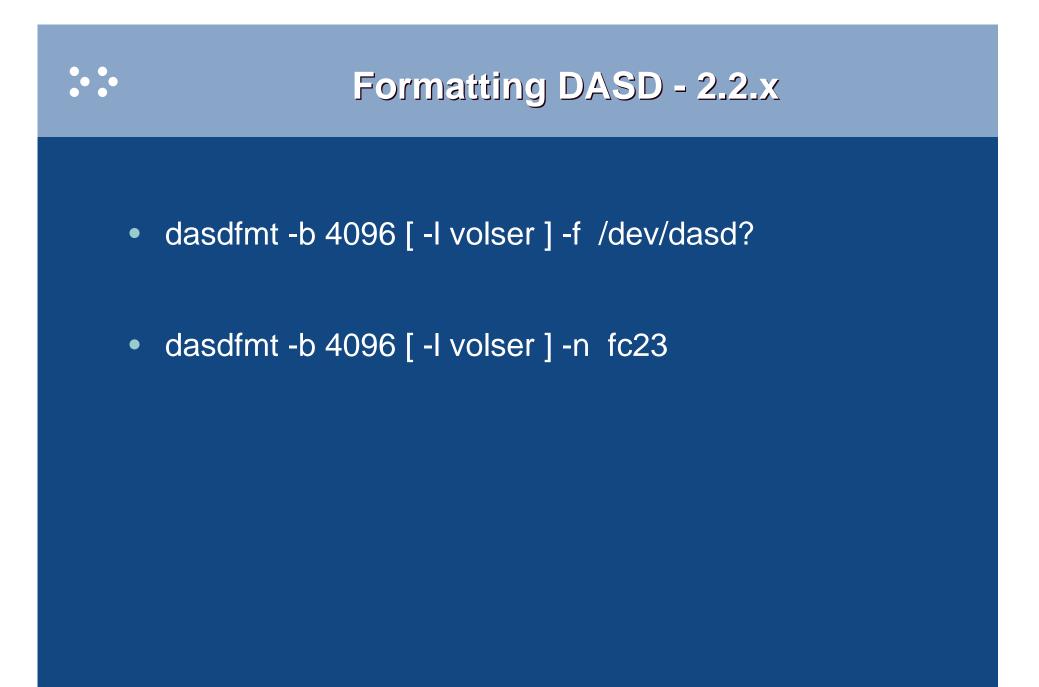

Copyright 2002-2006 by Mark Post

Formatting DASD - 2.4.x, 2.6.x

dasdfmt -b 4096 [-l volser] [-d layout] -f /dev/dasd? -n 0d18 (only if devfs is in use)
dasdfmt -b 4096 -d cdl -f /dev/dasda
dasdfmt -b 4096 -d ldl -n 0cf3
dasdfmt -b 4096 -d cdl -n 0d2f

• fdasd /dev/dasd?

Must create one, two, or three partitions

Creating file systems and Swap

• 2.4.x, 2.6.x Kernels

- mke2fs -b 4096 /dev/dasd?1,2,3
 - mke2fs -b 4096 /dev/dasda1
 - mke2fs -b 4096 /dev/dasda2
 - mke2fs -b 4096 /dev/dasda3
- 2.2.x Kernels
 - mke2fs -b 4096 /dev/dasd?1
 - mke2fs -b 4096 /dev/dasda1
 - mke2fs -b 4096 /dev/dasdb1
- mkswap /dev/dasd?1 (2.2 kernels)

• mkswap /dev/dasd?1,2,3 (2.4 kernels) 04/09/2006 Copyright 2002-2006 by Mark Post

File systems vs. directories

/ (root)	/opt
/bin	/proc
/boot *	/root (not to be confused
/dev	with / root)
/etc	/sbin
/home	/tmp
/lib	/usr
/mnt	/var

Backup and restore

- Native Linux facilities
 - afio/cpio/tar
- Software packages (Open Source and proprietary)
 - Amanda / offlindr
 - DFSMSdss / DDR
 - Tivoli TSM/ADSM
 - Innovation FDRINSTANT/UPSTREAM
 - CA BrightStor
 - SecureAgent SecureBackup
 - UTS Global TSS-BAR
 - Veritas NetBackup

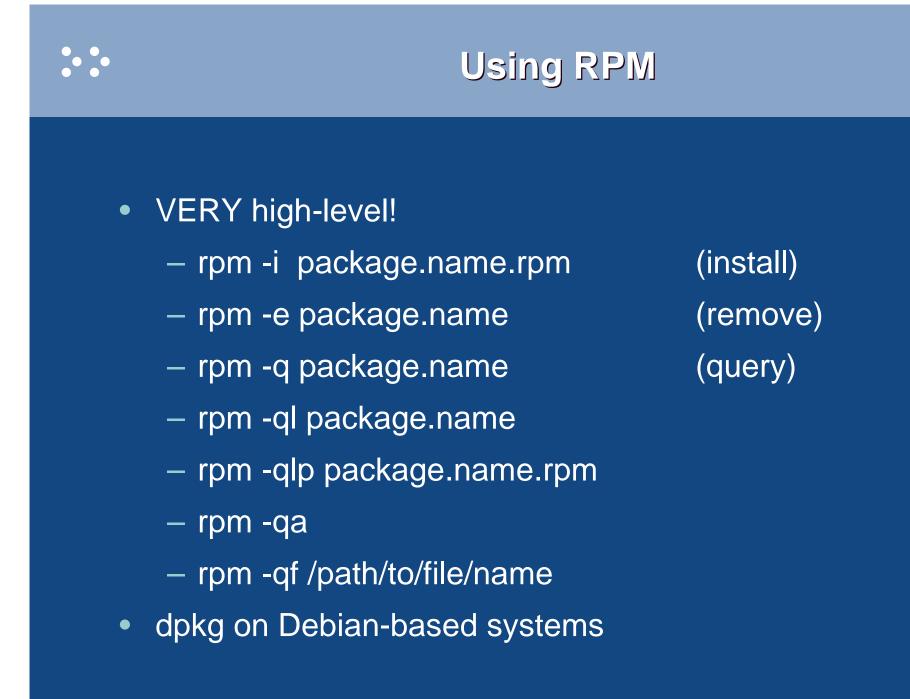

- Since there is no such thing as SMP/E or SES, you have to learn a new mindset.
- There are "binary" packages for several platforms, primarily Intel. Different distributions use different methods to manage those packages: RPM, dpkg.
- Source packages (RPM, tar.gz, etc.) are always available for Open Source software.

Software & maintenance management (2)

- In a number of cases, there is no binary available for Linux/390. Compiling from source is the only option. This can be *very* easy or *very* difficult, depending on the package.
- You will become very familiar with the 'tar,' 'gzip,' and 'make' commands. Most likely 'patch' and 'diff' as well.

Software & maintenance management (3)

- Keeping track of security patches is *very* important, and people-intensive.
- Getting email notifications from security sources (CERT, etc.) is recommended.
- If you have to install a package from source, it probably won't be too difficult.
 - tar -zxf package.name.tar.gz
 - cd package-directory
 - ./configure
 - make, and then make install

Data sharing with Linux/390 and other OS

- No direct, hard-wired sharing
- z/OS and z/VM don't "know" ext2
- Linux doesn't "know" VTOCS, etc.
 - Except now it does. But, no security!
- Various network-based methods
 - -NFS
 - GFS
 - -AFS
 - Samba (SMB / CIFS / MS Networking)
- Under VM sharing minidisks *read-only* between guests.

- queue

04/09/2006

- OpenPBS
- generic NQS

Security and user management

- Security in an ongoing process, not a status. It must be constantly attended to for you to have any chance at all.
- Most successful security breaches come from employees of a company, not outsiders.
- In contrast to typical mainframe security, Linux security is more network oriented.
- If possible, have a UNIX security person handle your Linux security needs.

- Turn off ALL unnecessary services: telnet, ftp, smtp, time, finger, http, pop3, imap, login, shell, printer, nfs, etc., etc.
- Use OpenSSH instead of telnet, ftp, rlogin, rsh, rexec, rlogin, etc..
- Use shadow password utilities.
- Use TCP Wrappers (/etc/hosts.allow, etc.)
- Review your system logs regularly.
- Monitor security alerts from your suppliers, and from various security organizations.

- Don't lump all your users into one group (typically "users").
- Don't create a separate group for each user (Red Hat's approach).
- Try to have reasonable groups defined so that people can share data appropriately, and put the proper users into them.
- Don't give anyone a UID of zero unless it's absolutely necessary (and even then think about other ways to avoid it).

- Various tools are available for adding, deleting and changing user and group definitions. All information about users and groups are in plain text files.
- SuSE has YaST
- Red Hat has Nautilus and redhat-config-* tools
- Webmin is popular
- linuxconf was popular, but should not be used
- useradd, userdel, usermod, groupadd, groupdel, groupmod are common

- Protect the password of "root" very carefully.
- Login as "yourself" and su to root only when really needed.
- Consider using /etc/suauth to allow designated people to "su" using their own password.
- Consider using /etc/sudoers to grant some selected command authority to designated people.

Diagnostic information

- strace
- ulimit (to enable core dumps)
- gdb
- uptime
- top
- ksymoops

- netstat
- ping
- traceroute
- system logs
- dmesg
- standalone dump (2.4.x and 2.6.x kernels only)

Editors (Holy War fodder)

- vi / vim / elvis
- emacs / xemacs
- joe
- jed
- jove
- ed (sed)

- nano
- pico
- ne
- ned (3270 enabled)
- Nedit
- THE (The Hessling Editor)

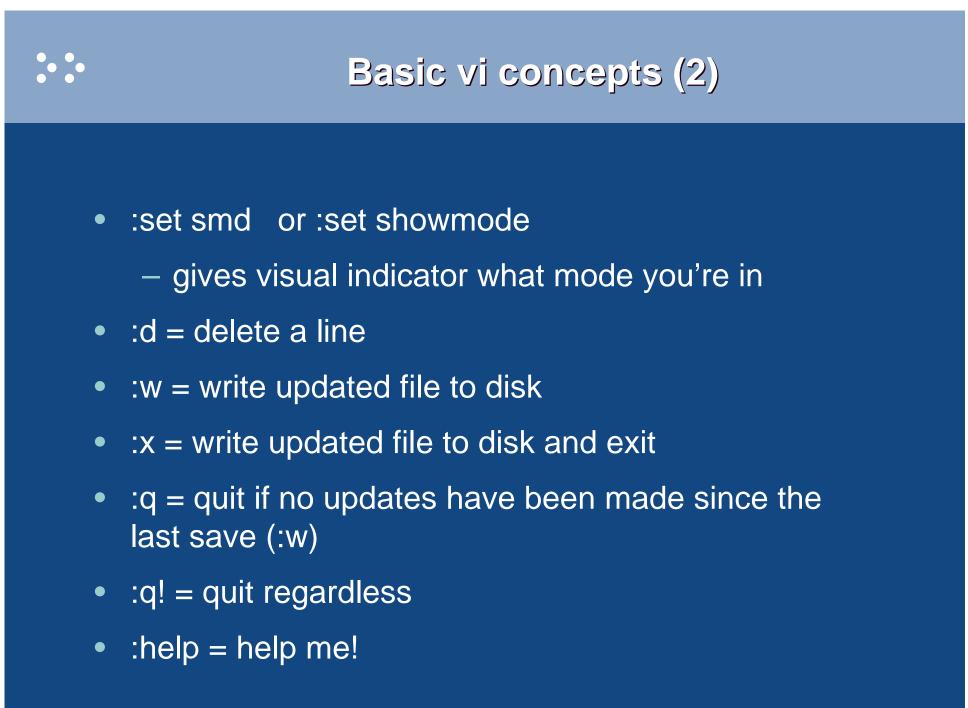

No native free ISPF/PDF clones. (2 proprietary ones)

Copyright 2002-2006 by Mark Post

••••

Basic vi concepts

- Cursor keys work as expected (or h-j-k-l), as do Page up and Page Down, Delete and Backspace (when ssh client is properly configured.)
- Two important modes: command, insert.
- I'm pretty unfamiliar with vi, so I basically use insert mode and command mode.
- Insert button = insert mode (twice = replace)
- ESC = exit insert/command mode to visual mode.

Scripting languages (Holy War cont.)

• perl

- ash / bash / csh / tcsh / ksh / ksh93 / zsh
- Regina (REXX)
- OREXX
- Tcl

System logs

- Most of what you want will be in /var/log, or in a subdirectory of it.
- Names and contents vary by distribution
- Reviewing them *frequently* is important
- Samples:
 - /var/log/messages
 - /var/log/syslog
 - /var/log/debug
 - /var/log/boot.log
 - /var/log/dmesg

- /var/log/proftpd.log
- /var/log/maillog
- /var/log/warn
- /var/log/httpd/...
- /var/log/samba/...

Basic commands

- rm -rf /*
- cd
- cp
- mv
- rm
- IS
- find

- grep
- cat
- less / more
- man
- info
- mount
- umount

- mkdir
- rmdir
- ps
- pushd
- popd
- which

Advanced commands

- ifconfig
- netstat
- route
- ping
- host / nslookup
- traceroute
- SU
- sudo
- gzip / bzip2
- last

- chmod
- chown
- dmesg
- du
- df
- locate
- top
- sed
- head
- tail

- silo / zipl
- wget
- export
- file
- insmod
- modprobe
- Ismod
- rmmod
- telinit

- The kernel contains all the code necessary to run as an operating system. This includes device drivers, file system drivers, networking code, etc.
- Kernel modules are parts of the kernel that don't have to be compiled into the kernel itself (but can be if you want to).
- This can allow you to update these components on the fly, without rebooting.

Kernel modules, insmod and modprobe (2)

- Since modules are *not* in the kernel, how do they get loaded into kernel storage?
 - insmod
 - modprobe
 - dynamically by the kernel if /etc/modules.conf has the right data in it.
- How does the module get it's parameters?
 - provided on insmod command
 - read from /etc/modules.conf by modprobe and the kernel.

Kernel modules, insmod and modprobe (3)

- How does the kernel find the module?
 - Usually in /lib/modules/kernelver/something...
 - depmod -a command creates a cross reference of the modules and where they are located, and writes it into /lib/modules/kernelver/modules.dep.
 - modprobe figures out the dependencies and loads the modules in the right order. insmod does not do this.

- From the HMC, just like any other OS, except no loadparms are needed/used.
- From VM, there are usually some CMS/CP commands issued in PROFILE EXEC, followed by a 'CP IPL devno CLEAR'
- From VM, you can still IPL from the reader, if desired.
- snIPL (simple network IPL)
- How the rest of the system is brought up by init is a very complex process, beyond the scope of this talk.

- When shutting down, it is important to do it *properly*. File system corruption and data loss can result otherwise.
- Use the halt, reboot or shutdown command.
- You can use shutdown to warn any logged on users, and/or set the shutdown to some time in the future.
- The shutdown command has options to reboot, halt, or cancel a previous shutdown command.

- Some "standalone" native Linux tools:
 - top, ntop, httperf, sar, iostat, gkrellm, pload, statnet, Big Brother, iptraf
 - Understand that in a shared environment, such as z/VM, these will *all* be lying to you in certain ways.
- Proprietary products
 - Velocity Software ESALPS (under z/VM)
 - BMC MAINVIEW
 - Candle OMEGAMON XE

Creating additional images

• Some commercial tools

- Can be done with home grown tools
- For large "penguin farms," knowing what to share between images and how is key.
- IBM Redbook "Linux on IBM zSeries and S/390: ISP/ASP Solutions," SG24-6299
